

ACKNOWLEDGEMENT

The satisfaction that accompanies the successful completion of any task would be incomplete without the mention of people whose ceaseless cooperation made it possible, whose constant guidance and encouragement crown all efforts with success.

We take this opportunity to express our deep sense of gratitude to our honorable principal Prof. K.S Jagadeesh , Principal, Govt. First Grade College, Tumkur, for providing excellent academic climate in the college that made this endeavors possible.

We are grateful to our project guide Haridas S for the guidance, inspiration and constructive suggestions that helped us in the preparation of this project.

Our wholehearted admiration and deep sense of gratitude to our H.O.D. of computer science, A R Mahesh and Mrs. Husna Sultana for their inspiration, valuable guidance, encouragement, suggestions and overall help throughout the successful completion of our project.

We are intended to our other teaching staff of our Computer Science Department and friends for helping us in carrying out the project successfully.

We are thankful to our non-teaching staff of our college for helping us in carrying the project successfully. Lastly we wish to reward our self of this opportunity to express a sense of gratitude and love to our friends and beloved parents for their support, strength and help.

ABSTRACT

This project is developed for the threat free and user oriented Online Voting System. The Online Voting system is made for the people of the country residing around the world and wants to vote for their representative. The election can be conducted in two ways the paper ballot election and the automated ballot elections.

The automated ballot elections are called the electronic voting. The online voting system is highly developed and the online polling system can be replaced by accurately and directly voting online and immediate results. The online voting system is done by the internet so it can be called the Internet Voting.

This online voting/polling system seeks to address the above issues. It should be noted that with this system in place, the users, citizens in this case shall be given ample time during the voting period.

INTRODUCTION TO ONLINE VOTING SYSTEM

The Project is named as Online Voting System which is content based site. The aim of this project is to provide help to the people of different location. The technology used for the creation of this project is HTML & PHP as the Front - End and the MY SQL as the back - End for the storage of data.

The word a "Vote" means to choose from a list, to elect or to determine. The main goal of voting is to come up with leaders of the people's choice. Most countries, India not an exception have problems when it comes to voting. Some of the problems involved include rigging votes during election, insecure or inaccessible polling stations, inadequate polling materials and also inexperienced personnel.

This online voting/polling system seeks to address the above issues. It should be noted that with this system in place, the users, citizens in this case shall be given ample time during the voting period.

This project is developed for the threat free and user oriented Online Voting System. The Online Voting system is made for the people of the country residing around the world and wants to vote for their representative. The election can be conducted in two ways the paper ballot election and the automated ballot elections.

The automated ballot elections are called the electronic voting. The online voting system is highly developed and the online polling system can be replaced by accurately and directly voting online and immediate results. The online voting system is done by the internet so it can be called the Internet Voting.

Online Voting System project is implemented in Asp.Net platform using Mysql database as back end. Main aim of Online Voting System is to develop an online application like online reservation system, for citizens who are above 18 years of age to vote through online. Using these system citizens of India can vote through online without visiting polling booth. A centralized database is maintained by election commission of India where citizens information is maintained whenever citizen is using Online Voting System his/her information is authenticated with the data present in database if user is not in the list he cannot use Online Voting System

INTRODUCTION TO LANGUAGE

INTRODUCTION TO HTML

What is HTML?

HTML is a language for describing web pages.

- HTML stands for Hyper Text Markup Language.
- HTML is a markup language.
- A markup language is a set of markup tags.
- The tags describe document content.
- HTML documents contain HTML tags and plain text.
- HTML documents are also called web pages.

HTML Tags:

HTML markup tags are usually called HTML tags.

- HTML tags are keywords (tag names) surrounded by angle brackets like <html>.
- HTML tags normally come in pairs like and .
- The first tag in a pair is the start tag, the second tag is the end tag.
- The end tag is written like the start tag, with a forward slash before the tag name.
- Start and end tags are also called opening tags and closing tags.

<tagname> content </tagname>

HTML Elements:

"HTML tags" and "HTML elements" are often used to describe the same thing.

But strictly speaking, an HTML element is everything between the start tag and the end tag, including the tags:

HTML Element: <p>This is a paragraph.</p>

Web Browsers:

The purpose of a web browser (such as Google Chrome, Internet Explorer, Firefox, Safari) is to read HTML documents and display them as web pages. The browser does not display the HTML tags, but uses the tags to interpret the content of the page.

HTML Page Structure:

Below is a visualization of an HTML page structure:

```
<html>
<body>
<h1>This a heading</h1>
<p>This is a paragraph.</p>
<p>This is another paragraph.</p>
</body>
</html>
```

Writing HTML Using Notepad++ or Text Edit

HTML can be edited by using a professional HTML editor like:

- Adobe Dreamweaver
- Microsoft Expression Web
- Notepad++ Editor

However, for learning HTML we recommend a text editor like Notepad (PC) or TextEdit (Mac). We believe using a simple text editor is a good way to learn HTML.

Styling HTML with CSS:

CSS was introduced together with HTML 4, to provide a better way to style HTML elements.

CSS can be added to HTML in the following ways:

- Inline - using the style **attribute** in HTML elements
- Internal - using the **<style> element** in the **<head>** section
- External - using an external CSS **file**

The preferred way to add CSS to HTML, is to put CSS syntax in separate CSS files.

Inline Styles

An inline style can be used if a unique style is to be applied to one single occurrence of an element. To use inline styles, use the style attribute in the relevant tag. The style attribute can contain any CSS property. The example below shows how to change the text color and the left margin of a paragraph:

```
<p style="color:blue;margin-left:20px;">This is a paragraph.</p>
```

Browser Support:

Internet Explorer 9, Firefox, Opera, Chrome, and Safari support the <video> element.

What is CSS?

Cascading Style Sheets, fondly referred to as CSS, is a simple design language intended to simplify the process of making web pages presentable. CSS handles the look and feel part of a web page. Using CSS, you can control the color of the text, the style of fonts, the spacing between paragraphs, how columns are sized and laid out, what background images or colors are used, as well as a variety of other effects.

CSS is easy to learn and understand but it provides a powerful control over the presentation of an HTML document. Most commonly, CSS is combined with the markup languages HTML or XHTML.

Advantages of CSS:

- CSS saves time - You can write CSS once and then reuse the same sheet in multiple HTML pages. You can define a style for each HTML element and apply it to as many web pages as you want.
- Pages load faster - If you are using CSS, you do not need to write HTML tag attributes every time. Just write one CSS rule of a tag and apply it to all the occurrences of that tag. So, less code means faster download times.
- Easy maintenance - To make a global change, simply change the style, and all the elements in all the web pages will be updated automatically.
- Superior styles to HTML - CSS has a much wider array of attributes than HTML, so you can give a far better look to your HTML page in comparison to HTML attributes.
- Multiple Device Compatibility - Style sheets allow content to be optimized for more than one type of device. By using the same HTML document, different versions of a website can be presented for handheld devices such as PDAs and cellphones or for printing.
- Global web standards – Now HTML attributes are being deprecated and it is being recommended to use CSS. So it's a good idea to start using CSS in all the HTML pages to make them compatible with future browsers.

INTRODUCTION TO PHP

PHP stands for Hypertext Pre-processor, is a simple, fast, portable scripting language suitable for developing database-enabled Web sites. It is currently powering tens of millions of Web sites worldwide.

PHP is basically used for developing web based software applications. PHP started out as a small open source project that evolved as more and more people found out how useful it was. Rasmus Lerdorf unleashed the first version of PHP way back in 1994.

PHP is a recursive acronym for "PHP: Hypertext Preprocessor".

- PHP is a server side scripting language that is embedded in HTML. It is used to manage dynamic content, databases, session tracking, even build entire e-commerce sites.
- It is integrated with a number of popular databases, including MySQL, PostgreSQL, Oracle, Sybase, Informix, and Microsoft SQL Server.
- PHP is pleasingly zippy in its execution, especially when compiled as an Apache module on the Unix side. The MySQL server, once started, executes even very complex queries with huge result sets in record-setting time.
- PHP supports a large number of major protocols such as POP3, IMAP, and LDAP. PHP4 added support for Java and distributed object architectures (COM and CORBA), making n-tier development a possibility for the first time.
- PHP is forgiving: PHP language tries to be as forgiving as possible.
- PHP Syntax is C-Like.

Common uses of PHP:

- PHP performs system functions, i.e. from files on a system it can create, open, read, write, and close them.
- PHP can handle forms, i.e. gather data from files, save data to a file, thru email you can send data, return data to the user.
- You add, delete, modify elements within your database thru PHP.
- Access cookies variables and set cookies.
- Using PHP, you can restrict users to access some pages of your website.
- It can encrypt data.

Characteristics of PHP:

Five important characteristics make PHP's practical nature possible:

- Simplicity
- Efficiency
- Security
- Flexibility
- Familiarity

HARDWARE AND SOFTWARE REQUIREMENTS

SOFTWARE REQUIREMENTS:

System software : WINDOWS OPERATING SYSTEM.
Application Software : Google Chrome, Internet explore
TOOLS : HTML and CSS AND PHP

HARDWARE REQUIREMENTS:

Any PC compatible : Pentium 2 or Higher
Memory “RAM” : 256 MB or Higher
Free Space : 800 MB or Higher
Operating System : Windows XP 2000 or Higher

SCREENSHOT

Admin login:-

Admin can login here using through different types of login validation such as username, password and email address

The screenshot displays the 'Administrator Log-in' interface. At the top, a dark header bar contains the text 'Voting Sytem'. The main content area has a light yellow background. Centered on this background is the 'Administrator Log-in' form. The form includes three input fields: 'Username' with a person icon, 'Password' with a lock icon, and 'E-mail Address' with an email icon. Below these fields is a red 'Submit' button. At the bottom of the page, a dark footer bar displays 'Version 1.0'.

Version 1.0

Admin Home page:

It is the home page of admin ,after successfully login of admin login page. It show different modules and special task of online voting system

Add Organization:

Admin can host the concept of voting or organization. It is the beginning process of voting process. At a time he can host multiple organization for vote

The screenshot shows a web browser window with the title 'Administrator Login'. The address bar displays 'localhost/voting_system/sandbox/add_org.php'. The navigation menu includes 'Home', 'Add Organization', 'Add Position', 'Add Nominees', 'Voters List', 'Vote Result', and 'Admin'. The main content area is divided into two sections: 'Add Organization' and 'List of Organizations'.

Add Organization

Organization

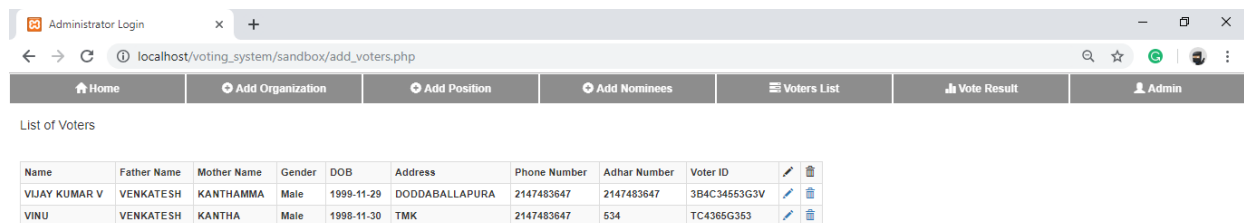

List of Organizations

Organization		
KAR 2018-19		
BENGALORE GOLF CLUB		

The Windows taskbar at the bottom shows the system clock as 10:41 and the language as ENG.

Voters list:

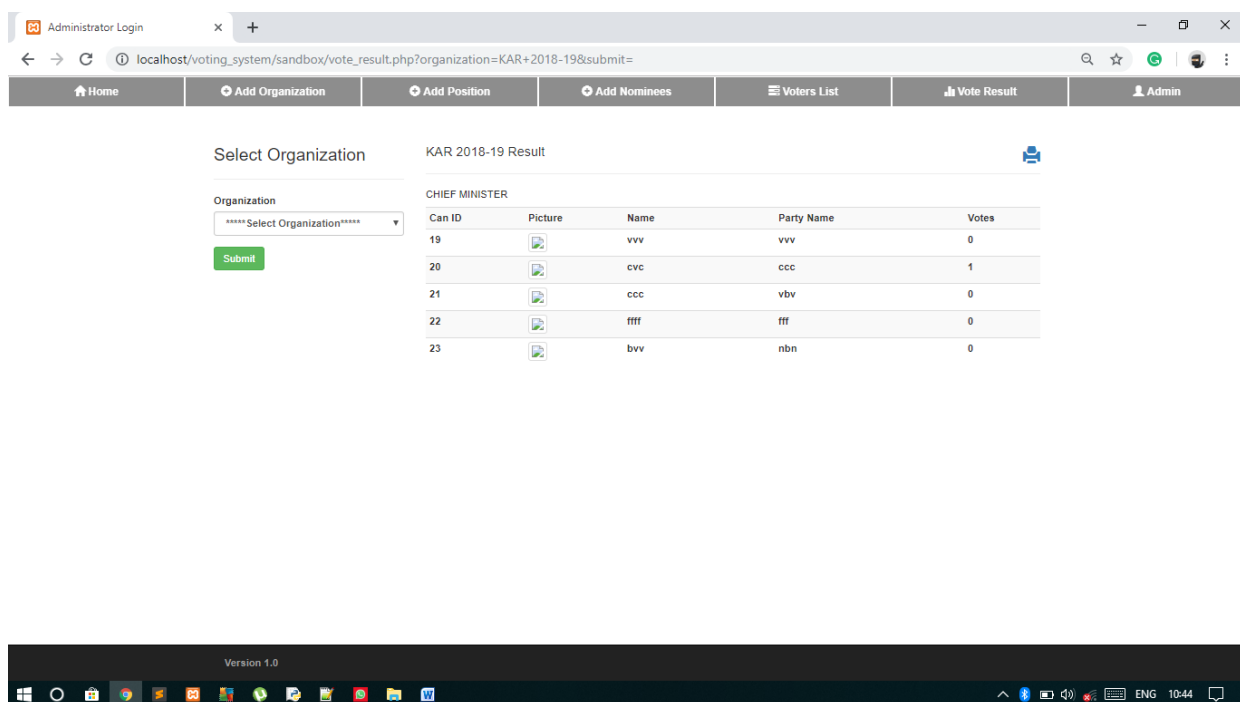

Admin can see the whole list of the voters are register to vote through online voting registration form. Admin can view the voters information except their password

Name	Father Name	Mother Name	Gender	DOB	Address	Phone Number	Adhar Number	Voter ID		
VIJAY KUMAR V	VENKATESH	KANTHAMMA	Male	1999-11-29	DODDABALLAPURA	2147483647	2147483647	3B4C34553G3V		
VINU	VENKATESH	KANTHA	Male	1998-11-30	TMK	2147483647	534	TC4365G353		

Vote Result:

Voters vote their selected nominee, at the end of the voting process admin can check the winner of the voting process and also can view how much votes every nominee got in online voting system

Voting Page:

It is the voting page. Voter can independently elect nominees of voting system. Only one vote is valid for one voter, he can't select multiple nominees

CONCLUSION

- Online voting technology has not yet reached a level where the benefits of online voting would be greater than its risks.
- From the technical point of view, it would be possible to implement an online voting system, but there are deficiencies in how the verifiability and the prevention of pressuring voters could be reconciled.
- In practice, voters would have to be able to ensure that their vote has been counted as cast, but the system should still not produce a receipt that could be used to pressure voters or sell votes. The most significant risk is related to voters' confidence and the possibility of losing it.
- It is possible to shake voters' confidence in the voting system even without any actual technical capabilities, since harm can be done just by spreading false information and rumors. When votes can be concretely counted and recounted, it is easy to remove any suspicions of manipulation of the election results, at least.
- The electoral organization should have the means to identify harmful activities, prevent them and obtain the evidence required to bring criminal charges or to verify that the election result is indisputable and no manipulation has taken place.
- Currently, this is not yet possible. A separate recount of votes to detect and correct mistakes that have occurred in the vote count is not possible in online voting.
- In an online voting system, the information produced by the system on which votes have been counted needs to be trusted.
- If a recount of votes was carried out in an online voting system, it would be based on the information produced by the system itself and would give the same result as the actual count.
